Washington DC

## ENVISION

The design objective was to achieve quality lighting using LEED guidelines as the entire project was being submitted for LEED accreditation.

Lighting the architectural materials to use the reflected light became our primary concept enabling the use of fluorescent as the primary light source. In treatment rooms, clients could create their own atmospheric color from remotely located RGB LED technology.

Ambient light for the reception desk and other area was implemented using semi-custom fabric wrapped cylinder pendants. The large glass partition was backlit using digital LED flood light for color accent and flexibility between day & night functions.
